

# IMPACT REPORT

## CLIMATE COORDINATION NETWORK

Over the last three years, we've funded 389 early-stage climate projects across 56 countries - often being the first believer in a founder's vision. For many, we were the first cheque, the first signal of legitimacy, the first step toward long-term survival. But the reality is this: the funding landscape is still failing early-stage climate innovators. There are few mechanisms to get capital into the hands of grassroots builders - especially those in the Global South - when they need it most.

Right now, we are raising funds for 2025/26. Our goal is to distribute at least \$1M in 2025/26. We are exploring new funding allocation methods and building partnerships with organizations and individuals who want to support this crucial work. If we want to continue fueling this early-stage climate innovation pipeline, we urgently need:

- Philanthropic and catalytic capital to run additional grant rounds in 2025/2026.
- Partners and institutions willing to co-create and co-fund future rounds with us.

If you're an ecosystem builder, funder, or aligned organization, we ask you to reach out. We are ready to collaborate, host, or co-design rounds with your climate thesis. This report is not a victory lap; it's a call to action. Let's fill the gap between ideas and scale, together.

With gratitude,  
Jon, Tarah, Pranav, Ben, and Marco  
Climate Coordination Network Core Team

We're on a mission to accelerate blockchain-enabled climate solutions on a global scale, catalyzing diverse forms of climate action in order to create a sustainable and equitable future for all. Through strategic grant distribution coupled with support, we empower climate projects that are dedicated to reducing greenhouse gas emissions and serving as essential core infrastructure for web3 climate solutions.

Climate Coordination Network has empowered the community to turn climate concern into collective action; funding high-impact projects, advancing on-chain carbon markets, and fostering transparency in climate finance. Thanks to crypto-native funding, we've built tools that bridge Web3 innovation with real-world environmental impact, proving decentralized communities can lead the fight against climate change. Together, we can make crypto a force for planetary good.

**Nearly four** years ago, in December of 2021, we started our journey as a small team funding a few projects within Gitcoin. We were driven by a shared belief that web3 could redefine many of the parameters of climate action including how it is funded. Gitcoin as a platform was created to fund public goods...

## **Creating a stable climate for all the world's inhabitants is the ultimate public good.**

We launched our first climate round in Gitcoin Grant Round 12. It was a year where the Earth itself seemed to cry out in protest - heatwaves scorched records into dust, floods swallowed cities whole, and fires painted skies in apocalyptic hues. From the deadly heat dome that melted roads in Canada to the torrential rains that drowned European villages in minutes, nature's warnings were relentless. The Atlantic hurled Hurricane Ida onto Louisiana before sending its remnants to drown New York, while Madagascar starved under a drought-driven famine, its people the first official victims of climate-induced hunger.

Even as world leaders gathered at COP26, debating promises too slow and too small, the message was clear: the age of climate consequences had arrived. The question was no longer whether we would act, but whether we would act in time.

## **The climate crisis demands urgency, creativity, and collaboration.**

We're honoured to have played a small role in this critical work over the past 3+ years.

Today, the Climate Coordination Network has grown into a global force, distributing \$5.5M to hundreds of small projects; from Indigenous-led forest conservation to decentralized solar grids. This report celebrates what we've achieved together and the innovators who inspire us - 389 groundbreaking projects across 56 countries.

This report tells their stories - of Indigenous forest guardians using blockchain to protect ancestral lands, African farmers earning carbon credits through satellite verification, and solar pioneers bringing light to the last mile. These aren't hypothetical solutions; they're living proof that another world can be built right now.

The road ahead remains steep, but the path is clear. With continued support, we'll scale what works, bridge web3 with frontline communities, and prove that decentralized action can meet this crisis at the speed required.

# Where in the World...

Climate Action is happening in the most unlikely of places...

Our supported projects have spanned 56 countries around the world and have ranged from tiny low-tech microgreens grown on rooftops in Bangladesh to high tech Global satellite-tracked reforestation.

This isn't just funding; it's oxygen for the grassroots innovators who are rewriting our climate future. From blockchain-protected rainforests to solar microgrids powering off-grid villages, every dollar has been a vote for a livable planet.

# The Numbers That Matter

| Round      | Dates      | Crowdfunded \$ | Match Pool \$ | Total \$ Deployed | Projects Fueled            |
|------------|------------|----------------|---------------|-------------------|----------------------------|
| GR12       | Dec. 2021  | 403,425        | 300,000       | 703,425           | 26                         |
| GR13       | March 2022 | 176,322        | 465,000       | 641,322           | 97                         |
| GR14       | June 2022  | 98,548         | 500,000       | 598,548           | 145                        |
| GR15       | Sept 2022  | 114,667        | 350,000       | 464,667           | 199                        |
| GG16       | Jan 2023   | 76,422         | 333,333       | 409,755           | 50                         |
| GG17       | May 2023   | 40,613         | 350,000       | 390,613           | 104                        |
| GG18       | Aug 2023   | 34,438         | 350,000       | 384,438           | 89                         |
| GG19       | Nov 2023   | 35,313         | 250,000       | 285,313           | 100                        |
| GG20       | April 2024 | 58,010         | 300,000       | 358,010           | 129                        |
| GG21       | Aug 2024   | 22,069         | 250,000       | 272,069           | 71                         |
| GIV-Earth  | June 2024  | 44,735         | 40,000        | 84,735            | 75                         |
| Jokerace   | Sept 2024  | -              | 25,000        | 25,000            | 10 winners                 |
| Octant Ep7 | April 2025 | -              | 1,000,000     | 1,000,000         | 20                         |
| TOTAL      |            | 1,104,562      | 4,513,333     | 5,617,895         | 1115 (389 unique projects) |

**389 Experiments in Survival—each project a bet on a cooler, fairer future.**

# Where the Money Went: Real-World Impact

# WHICH PROJECTS DID WE FUND?

# Regenerative Agriculture, Ecosystem Restoration and Food Security

15%

Soil is not dirt - it is the skin of the living world, and we have scarred it. Regenerative agriculture heals those wounds. This is how we stitch the land back together, one root, one seed, one breath at a time.

A global shift to regenerative agriculture could sequester over 20% of current annual CO<sub>2</sub> emissions.

15%

## Forestry and Reforestation

Restoring 350 million hectares of degraded forests could sequester 1.7 billion tons of CO<sub>2</sub> per year.

Forests are the lungs of the planet, and we have been holding our breath for too long. Reforestation is the act of exhaling; planting trees that will outlive us, that will whisper our repentance to the sky. Every sapling is a promise: the future will be greener than the past.

## Ocean Regeneration

6%

The sea does not forget. It remembers every drop of poison, every net left to strangle. Ocean regeneration is crucial; restoring coral reefs, rewilding mangroves and kelp forests. Because a living ocean means a living world.

Coral reefs and coastal ecosystems like mangroves store 5x more carbon per acre than tropical forests, while kelp forests absorb up to 20 tons of CO<sub>2</sub> per hectare annually.

5%

## Conservation & Biodiversity

Conservation is the fight to save what remains; the last tigers, the vanishing bees, the ecosystems that hum with life.

Protecting just 1.2% of Earth's land could prevent 60% of projected species extinctions; including 75% of vital crop-pollinating bees, responsible for nearly every third bite of food humans eat.

## Renewable Energy

8%

The sun, wind, and rivers whisper the same truth: energy need not cost the Earth. Renewable energy projects dismantle the fossil empire, one solar panel and turbine at a time, electrifying the future without burning the past.

Solar and wind could avoid 23 billion tons of CO<sub>2</sub> by 2050, EVs could cut transport emissions by 50-70%, together with other renewables they could transform global energy: if we choose to scale them

13%

## Web3 & ReFi Infrastructure

The old systems broke the world; the new ones must repair it. Web3 is a toolbox: blockchain for transparency, DAOs for democracy, tokens for trust.

Blockchain infrastructure; from energy-efficient smart contracts to tokenized carbon markets and transparent supply chains; has the potential to slash millions of tons of GHG emissions by revolutionizing verification, renewable energy trading, and offset accountability

## Decentralized & Sustainable Economies

11%

Centralization is the cult of more;  
decentralization is the art of enough.

Decentralized systems enable communities to directly govern renewable energy, circular production, and carbon markets; collectively avoiding up to a billion tons of CO<sub>2</sub> annually

11%

## Community, Education, Advocacy and Activism

From school strikes to shareholder rebellions, advocacy, activism, and education have shifted global power dynamics; resulting in 75% of Fortune 500 companies now disclosing emissions and 90% of G20 nations creating climate plans.

Change begins where people gather. Education is the spark; community is the fire. Together, they turn fear into action, despair into determination.

## Indigenous and Grassroots Support

3%

Indigenous-led activism protects 80% of global biodiversity while occupying just 20% of land, yet receives <1% of climate funding.

Indigenous communities have stewarded the earth for millennia; now, their voices lead the way. From land defenders to seed keepers, grassroots movements are rewriting the future.

5%

## Carbon Accounting and Off setting

The atmosphere keeps a ledger, and we are deep in debt. Carbon accounting is the reckoning—measuring what we owe, then paying it back through forests, soil, and sky. Offsetting is not absolution, but it is a start: the first step toward balance.

Carbon accounting + offsetting could slash 8B tons/year of Green House Gas emissions if all Fortune 500 firms agreed to the 'net-zero by 2030' pledge with verified it with action.

## Waste Management

3%

Better waste management; like landfill methane capture, composting and plastic recycling could slash global GHG emissions by 10-15% by 2030.

We built a civilization on trash, and now the trash is building itself into mountains. Waste management is the great unmaking; turning landfills into lessons, plastic into possibility. This is the cleanup after the party we never should have thrown.

5%

## Hybrid Projects

Not every solution fits neatly into a box. Hybrid projects are the wildcards; the hackers, the poets, the mad scientists stitching together improbable answers. They remind us that the fight against climate change needs every kind of mind, every kind of heart.

# Astral Protocol

## Building a Decentralized Geospatial Future

U.K.

Imagine a world where your location data belongs to you—not corporations. Astral Protocol, an open-source R&D studio, is making this vision real by pioneering the decentralized geospatial web. Their tools empower developers to build privacy-focused alternatives to Google Maps, Uber, and Tinder—putting users back in control.

### From Grants to Groundbreaking Tools

Fueled entirely by public goods funding, Astral has raised \$45,000+ through Gitcoin & CCN Grants (10 rounds), enabling them to:

- Develop a beta Location Proof Protocol and user-friendly Astral Logbook app.
- Sponsor hackathons (like Funding the Commons x EarthCommons), attracting 9 projects building on their tech.
- Advance zero-knowledge location proofs (e.g., zkMaps, an ETHDenver finalist).
- Partner with the University of Maryland to decentralize satellite imagery storage on IPFS—boosting climate and urban planning applications.

Today, Astral's ecosystem is thriving: 10+ builders are creating tools for climate monitoring, community currencies, and more. Their academic collaborations are bridging Web3 and geospatial science, with peer-reviewed research on the horizon.

"We're not just building tech—we're fostering a movement," With CCN's support, Astral is turning the geospatial web into a public good—one proof-of-location at a time.

Astral's tech is already unlocking major potential for climate action. Their decentralized geospatial tools help verify reforestation projects (fighting the 10% of emissions from deforestation), track urban carbon footprints, and even validate satellite data for climate scientists—all while ensuring transparency in the \$2B carbon offset market.

# Blue Filter

## Clean Water for a Thirsty Planet

Palestine

For millions facing water scarcity and pollution, access to clean drinking water remains a daily struggle. Blue Filter tackles this crisis with an innovative, plant-based filtration technology—providing a sustainable, low-cost alternative to energy-intensive purification methods while reducing carbon emissions.

### From Seed to Solution

With \$10,000 won at the IGNITE Pitch Competition and over \$70,000 raised via GoFundMe, Blue Filter has:

- Developed an eco-friendly filtration system using plant seeds, eliminating reliance on harmful chemicals and high-energy processes.
- Begun scaling production to reach communities in Gaza, the West Bank, Egypt, Iraq, and Jordan, where water scarcity is acute.
- Laid the groundwork for local manufacturing and training programs, ensuring long-term adoption and economic empowerment.

"Water is life - but only if it's clean." Blue Filter's approach proves that nature-based solutions can combat both pollution and climate change. A single unit can save thousands of liters of contaminated water annually, while avoiding the CO<sub>2</sub> emissions of conventional purification.

Upcoming initiatives include:

- Expanding partnerships with NGOs and governments to deploy filters in disaster-stricken and drought-prone regions.
- Refining the technology for broader applications, including agricultural and industrial use.
- Training local technicians to maintain and distribute filters, creating jobs and self-sustaining water solutions.

With 2 billion people still lacking safe drinking water, Blue Filter's model could prevent millions of tons of CO<sub>2</sub> from energy-heavy desalination and chemical treatments; while saving lives. "We're not just filtering water; we're building resilience."

# The Solar Foundation

## Powering Climate Justice Through Solar Sovereignty

US/Africa

For millions in off-grid African communities, energy poverty means choosing between kerosene fumes and darkness. The Solar Foundation breaks this cycle by deploying solar microgrids and appliances—turning sunlight into financial freedom, education, and healthcare while slashing emissions.

### From Grants to Grids

With \$58,775 raised across 5 Gitcoin/CCN rounds, the Foundation has:

- Built 10+ solar projects in Nigeria, Tanzania, Uganda, and Kenya, including a hospital solar installation serving 2,000+ patients yearly.
- Distributed 400+ solar lanterns, replacing carcinogenic kerosene and boosting children's study time by 3 hours/night.
- Launched the OMAW microgrid in Tanzania—powering a school, charging 200 phones weekly, and offsetting 1 ton of CO<sub>2</sub> monthly.

"Solar is a climate multiplier": The Foundation's work proves decentralized energy can cut 12+ tons of CO<sub>2</sub> yearly per project while uplifting communities—a blueprint to electrify rural Africa without fossil fuels.

Upcoming projects like Solar Savings Circles (solar drip irrigation for women farmers) and the Liberia Solar + Internet Project show how clean energy tackles both poverty and emissions. "We're not just installing panels—we're igniting energy independence." With CCN's support, they're turning marginalized communities into clean energy pioneers.

With 600 million still off-grid, their model could avoid 50M+ tons of CO<sub>2</sub> annually if scaled.

# GainForest

AI + Blockchain for Indigenous Led  
Climate Action  
Switzerland

When rainforests burn, so does ancestral knowledge—but what if protecting ecosystems paid? GainForest's decentralized science platform turns Indigenous stewards into verified conservationists, using AI and blockchain to reward data that safeguards biodiversity.

With \$29,900+ raised across 11 Gitcoin/CCN rounds, GainForest has:

- Built AI tools to digitize Indigenous ecological knowledge, now used in COP negotiations.
- Launched Conservation Data Income, empowering communities to earn from hypercert-backed forest protection.
- Hosted EcoHackathon 2024 (130+ participants), spawning AI solutions for the Amazon.

"Indigenous communities protect 80% of biodiversity—our tech ensures they're paid for it."

Despite data sovereignty challenges, GainForest's hypercert-powered rewards and AI-driven verification are proving conservation can be profitable.

With CCN's support, they're bridging ancient wisdom and web3 to redefine climate justice.

GainForest's model could channel \$1B+ annually to frontline stewards by verifying their impact—scaling their current work with 28+ environmental partners across three continents.

# Solarpunk Nomads

Pioneering Zero-Carbon Nomadism  
for Climate Resilience

Italy

What if living lightly on the earth wasn't a sacrifice, but an adventure? Solarpunk Nomads (SPN) turns climate adaptation into a mobile, joyful movement—proving that zero-emission living can be scalable, educational, and even fun.

With \$49,000 raised across 8 Gitcoin/CCN rounds, SPN has:

- Built 4 zero-carbon vehicles, including a solar camper bike in Belgium and an electric tuk-tuk in India—each a rolling classroom for sustainable tech.
- Led 10+ workshops across 3 continents, teaching communities to merge mobility and regeneration.
- Established the first Solarpunk Hub in Italy—a physical prototype for nomadic resilience.

"Nomadism isn't about escaping—it's about engaging."

2024's tented camps proved the demand for immersive climate upskilling. Next, SPN will:

- Expand vehicle partnerships in the Global South.
- Scale residential workshops (next stops: LATAM and Southeast Asia).
- Grow the Italian Hub into a global training center.

"We're not just reducing footprints—we're creating pathways,"

With CCN's support, SPN is rewriting the future of travel—one solar-powered mile at a time.

SPN's model could mobilize 1M+ climate-aware travelers by 2030, cutting emissions while seeding local hubs. Their Climate Tracker and Guidebook are already helping others replicate their blueprint.

# Beyond Fossil Fuels

## Indigenous Stewardship as Climate Justice

Canada

For Indigenous peoples, land is not property; it is living law, woven through generations of reciprocal care. Beyond Fossil Fuels uplifts Indigenous legal battles where defending sovereignty isn't just about rights, but responsibility: the sacred duty to steward the earth in the face of climate collapse.

When Indigenous Laws Lead, the Earth Wins

Gitcoin/CCN funding has empowered:

- The Tiny House Warriors to reclaim Secwepemc land with 10 tiny homes; blocking the Trans Mountain pipeline while reviving traditional land guardianship.
- Tsleil-Waututh Nation's Sacred Trust to halt tar sands expansion through courts, protecting Salish Sea ecosystems their people have tended for millennia.
- A Challenge to Canada's climate inaction via the Wet'suwet'en Constitutional case, which could force the government to align with Paris Agreement limits.

"We aren't protesters; we're fulfilling our ancestral duty to the land."

Beyond Fossil Fuels isn't funding "lawsuits" it's supporting the reclamation of Indigenous stewardship as climate action.

# Blue Energy Reef

## Reviving Reefs with Blue Energy

Indonesia

Coral reefs, the "rainforests of the sea", are vanishing at an alarming rate, with 50% lost in the last 40 years. The Gili Eco Trust, in partnership with AquaGen, is fighting back by merging Biorock reef restoration with ocean-powered renewable energy, creating resilient reefs that grow up to 10x faster while running entirely on clean power.

The project has:

- Deployed the first blue-energy Biorock reef in Gili Trawangan, powered by AquaGen's Minnow marine turbine, a self-sustaining model for off-grid restoration.
- Proven Biorock's resilience, these structures helped reefs survive the 2016 mass bleaching event, with coral growth rates 8x faster than natural recovery.

*"Reefs don't just protect marine life, they protect us."* Coral reefs sequester 900M tons of CO<sub>2</sub> yearly, buffer 95% of wave energy, and support \$30B in global economic value. By powering Biorocks with ocean currents instead of diesel generators, the Trust cuts emissions while rebuilding these vital ecosystems.

With \$92,000 from the Octant funding round will scale:

- The Wave Donut micro-hydro system to harness Indonesia's powerful currents, replacing fossil fuels with 100% renewable energy for reef growth.
- Expand to remote reefs, using decentralized energy to restore fisheries and coastal resilience worldwide.

With 90% of reefs at risk by 2050, this model could replicate globally, turning ocean energy into a tool for carbon sequestration and coastal protection. *"We're not just saving corals, we're engineering climate resilience."*

# Kokonut Network

## Syntropic Agroforestry Revolution

Dominican Republic

For the 1.7 billion people living in degraded tropical ecosystems, Kokonut Network proves that Web3 can rebuild food forests—and economies—from the ground up. By combining syntropic agroforestry with decentralized governance, Kokonut turns barren land into biodiverse, income-generating farms while ensuring farmers own their data, carbon credits, and future.

With \$55,249.37 raised across 7 Gitcoin/CCN rounds (and 200+ contributors), Kokonut has:

- Built 3 operational farms in the Dominican Republic, with 3 more in development—each a living lab for regenerative finance.
- Pioneered a 6-month maturity model (down from 4 years!) using organic inputs, slashing corporate dependencies.
- Partnered with the Dominican Department of Agriculture to scale land rights for smallholders via blockchain titles.

### Scaling the Soil-to-Value Pipeline

Despite challenges like tropical soil depletion, Kokonut's open-source framework is proving that syntropic agroforestry can:

- Sequester 5x more carbon than monocultures (verified via satellite + ground sensors)
- Generate \$3,200+/hectare annual income from diversified crops (cacao, plantains, timber).
- Onboard farmers into ReFi through Hypercerts-for-Nature pilots (2024).
- 

*"We're not just planting trees—we're planting economic systems."*

Kokonut's model could triple tropical smallholder incomes while restoring degraded land. Their open-source playbook (coming 2025) will let any community replicate this, no corporate intermediaries.

# The Elephant Room

## Turning Climate Anxiety into Action

Canada

While fossil fuel companies spend billions on advertising and disinformation, climate solutions remain dangerously absent from public discourse. The Elephant Room bridges this gap by crafting high-impact multimedia campaigns that turn apathy into action; partnering with Indigenous communities, local governments, and activists to make climate solutions tangible, urgent, and impossible to ignore.

Campaigns that Shift the Narrative: From grassroots organizing to digital mobilization, The Elephant Room's work has:

- Stopped destructive projects like the Raven Coal Mine and supported the Tsleil Waututh Nation's decade-long fight against the Kinder Morgan pipeline.
- Pioneered award-winning programs like Cool Neighborhoods (UN-recognized) and The Great Climate Race, which funded renewable energy through community runs.
- Mobilized voters with VoteClimate campaigns, pressured governments to adopt Climate Action Plans (CAPs), and challenged harmful trade deals like Canada's FIPA treaty alongside the Hupacasath Nation.

"We meet people where they're at." Elephant Room's campaigns cut through noise by tying climate action to local values; whether through films, PSAs, or business coalitions like Conversations for Responsible Economic Development.

### Fighting Disinformation, Building Momentum

With under 1% of media covering climate—and even fewer highlighting solutions; The Elephant Room's model is a lifeline. "We don't just sound the alarm; we hand people the tools to turn it off." By merging storytelling with strategy, they're transforming fear into collective heroism.

In a world saturated with climate paralysis, The Elephant Room proves that when stories shift, so do power structures. Pipelines get stopped. Neighborhoods transform. And politicians either step up - or get stepped over.

# Atlantis

## Building the Impact Layer for Climate Action

India

What if every climate action - from village tree plantings to corporate sustainability - could be verified, connected, and rewarded? Atlantis is creating this reality with its peer-to-peer impact network, turning fragmented efforts into a global force for change.

With \$150,000+ raised across 13 Gitcoin/CCN rounds, Atlantis has:

- Launched Impact Miner (live) and Impact Foundry
- (beta) - the "GitHub for climate impact" that tracks
- and incentivizes real-world actions
- Validated their tech with Mercy Corp Ventures, proving viability for major NGOs
- Grown to 4,000+ members while generating early revenue - rare for public goods projects
- 

"We're bridging the \$4T climate funding gap one verified action at a time."

Despite adoption hurdles, Atlantis is proving offline communities will use on-chain tools when they see value:

- Their Latin America pilot shows 3x higher engagement when actions unlock microloans
- Impact Foundry's beta already tracks 200+ real-world projects

"Most impact reporting is either greenwashing or invisible - we're making it transparent and tradable," With CCN's support, they're building the infrastructure for a world where every climate action counts.

Atlantis' tools could connect 10M+ grassroots climate efforts to funding by 2030 - from African women's farming collectives to Southeast Asian mangrove restorers - creating the missing link between local action and global capital.

# Shamba Network

The dMRV Revolution for Smallholder Farmers

Kenya

For the 500 million smallholder farmers feeding the Global South, climate resilience is survival. Shamba Network bridges this gap with decentralized monitoring, reporting, and verification (dMRV) tools—turning satellite data and blockchain into financial lifelines for farmers and carbon markets alike.

With \$110,000+ raised across 4 Gitcoin/CCN rounds (and 1,500+ contributors), Shamba has:

- Built the Web3 Climate Oracle, delivering real-time ecological data to projects like Kenya's Diva Donate pilot.
- Developed dMRV tools combining satellite analytics with a mobile app, enabling 200,000+ tree plantings and youth-led ground-truth data collection.
- Onboarded 10,000+ farmers into carbon markets through workshops, linking regenerative practices to income.

## Scaling the Soil-to-Data Pipeline

Despite challenges like satellite accuracy gaps, Shamba's open dMRV protocol (in development) aims to become the global standard for trustless carbon credits. "We're not just measuring trees—we're measuring trust," With CCN's support, they've proved web3 can democratize climate finance. dMRV is the missing link for climate justice

Shamba's tools could verify 50M+ tons of CO<sub>2</sub> sequestration annually by smallholders—unlocking the \$10B voluntary carbon market for those who steward 80% of the world's farms. Their tech already ensures every dollar reaches farmers, not middlemen.

As the world grapples with abstract targets, CCN grantees are already living the future:

- Where protecting forests becomes more profitable than burning them
- Where energy systems heal rather than extract
- Where ocean sanctuaries become economic powerhouses, proving living seas are worth more than dead ones

The invitation stands: Stop watching the crisis. The Climate Clock is ticking. Here's what winning looks like:

- Every 10 mangroves planted = 1 ton of CO<sub>2</sub> sucked down yearly (while buffering storms)
- Every coral fragment outplanted = A reef revival for 200+ species (that coasts depend on)
- Every solar microgrid lit = 5,000 fewer liters of diesel burned (per family, per year)
- Every pipeline blocked = 1 million tons of CO<sub>2</sub> kept underground (and rivers kept clean)

This is the work that bends the curve—not in 2050, but today. Join us. [\\_Climatecoordination.org](https://climatecoordination.org)
